EXPERIENCE

Microsoft Azure, Cloud + AI San Francisco, CA

Software Engineer (Backend, Distributed Systems, Cloud Infrastructure) Jun 2024 — Present

- Scaled Azure Resource Graph's **8B+ events/day** ingestion pipeline, moving 20+ scale units to Premium Azure Event Hubs and growing one path from 9 to 17 endpoints/region in 5 regions via consumer-first rollouts, **cutting SLA breaches 40%**
- Extended a **cross-team C#/.NET ingestion contract** to accept Apache Spark NDJSON batches via async streaming deserialization without changing the legacy path, and enforced **partition-aligned batching** to reject cross-shard writes
- Sized capacity for a projected **300M extra events/day** by modeling **5.8K/sec bursts** against 95–99% regional CPU saturation, then scaled the bottlenecked Service Fabric clusters up to 29% and reconciled config drift with production
- Hardened ingestion against **replay collisions and poison messages** by replacing a 9,000-value blob-naming scheme with GUID-based identity and isolating malformed Event Hub messages to prevent **head-of-line blocking**
- Built **C# operator APIs** (Swagger/OpenAPI) for 2 services to inspect and update Event Hub writer access, letting on-call engineers drain a degraded hub through a validated control plane instead of hand-editing config
- Built a capacity-review dashboard (C# Azure Functions, React/TypeScript), then **removed its backend and auth** by rebuilding it as a static app that parses Bicep config into topology, VMSS capacity, and production-drift views
- Implemented **EU Data Boundary** notification routing for Azure Resource Notifications subscribers in 2 staged cohorts, made Global boundary behavior explicit after an incident, and identified **287 redundant Event Grid subscriptions**
- As on-call engineer for **Fortune 500 and government customers**, debugged incidents with Kusto (KQL), ETW traces, and PerfView, and built dashboards and an AI agent skill that map **956 of 962 Event Hub namespaces** to live telemetry

Walt Disney Animation Studios Burbank, CA

Software Engineer Intern (Full-Stack, Data Engineering) May 2023 — Aug 2023

- Built and shipped an internal platform on React, FastAPI, and the Autodesk ShotGrid REST API that **100+ production managers** use to manage animated clip metadata, now powering **every Disney Animation film production since 2024**
- Automated ingestion of **terabytes of cross-department production data** with Python, Apache Airflow, AWS, and Snowflake, adding monitoring and backfill-safe reruns to protect data integrity

Software Engineer Intern (Full-Stack, Data Engineering) May 2022 — Aug 2022

- Shipped **12 features and hotfixes** across internal production and employee-management tools (React, Django, GraphQL), covered them with Cypress tests, and migrated core services from JavaScript to TypeScript
- Built Python and Apache Airflow pipelines that sync employee profile metadata across internal systems via REST APIs, MySQL, and Ruby on Rails, **keeping employee records consistent** between them

TECHNICAL SKILLS

- **Languages:** Python, C#, JavaScript/TypeScript, HTML/CSS, SQL, GraphQL, PowerShell
- **Frameworks:** React, .NET, FastAPI, Express, Next.js, Django, Flask, Ruby on Rails
- **Data & Storage:** PostgreSQL, DynamoDB, Cosmos DB, Redis, MySQL, MongoDB, Firebase, SQLite, Supabase
- **Software & Tools:** Azure, AWS, GCP, Git, Node.js, CI/CD (GitHub Actions/Azure DevOps), Infrastructure as Code (Terraform), Microservices, Event Streaming, Observability, Performance Profiling, Postman

EDUCATION

California State University, Long Beach Long Beach, CA

B.S. Computer Science Aug 2020 — Dec 2023

Affiliations: Associated Engineering Student Body, Association for Computing Machinery, BeachHacks Organizing Committee, Computer Engineering/Science Student Advisory Board, ICPC Programming Team, The Aerospace Corporation's Dean's Leadership Academy, Engineering Honors Program, Google Developer Student Club, STEM Advantage Scholarship

PROJECTS AND PUBLICATIONS

Heaptree (*Website:* `https://heaptree.com/`) Jan 2025 — Dec 2025

- Built a developer platform (web + SDK) for **one-line headless VM provisioning** for isolated, ephemeral code execution and testing, using React/Next.js, TypeScript, Python, and AWS (EC2, DynamoDB, Lambda)

Comparative Study of Text-to-Image Models: A Focus on Subject-Specific Training for Improved Generation (*Publication:* `https://scholarworks.calstate.edu/concern/projects/pz50h376p`) Jan 2023 — Dec 2023

- Investigated **subject-specific fine-tuning** for text-to-image generation (Stable Diffusion 1.1 + LoRA), emphasizing evaluation methodology and comparative performance trade-offs for improved subject fidelity
